POST VIDEO IV

FIXPROOF

Resolving a recorded path-traversal uncertainty

PATH-S06 symbolic-link extension | Evidence preserved across study layers

1 REGISTERED CASE

5 SAVED CANDIDATES

0 OF 5 PASSED

Why the original result was inconclusive

DIRECT TRAVERSAL

`../../outside-zone/outside-secret.txt`

HTTP 400 - desired rejection

SYMBOLIC-LINK TRAVERSAL

`link/outside-secret.txt`

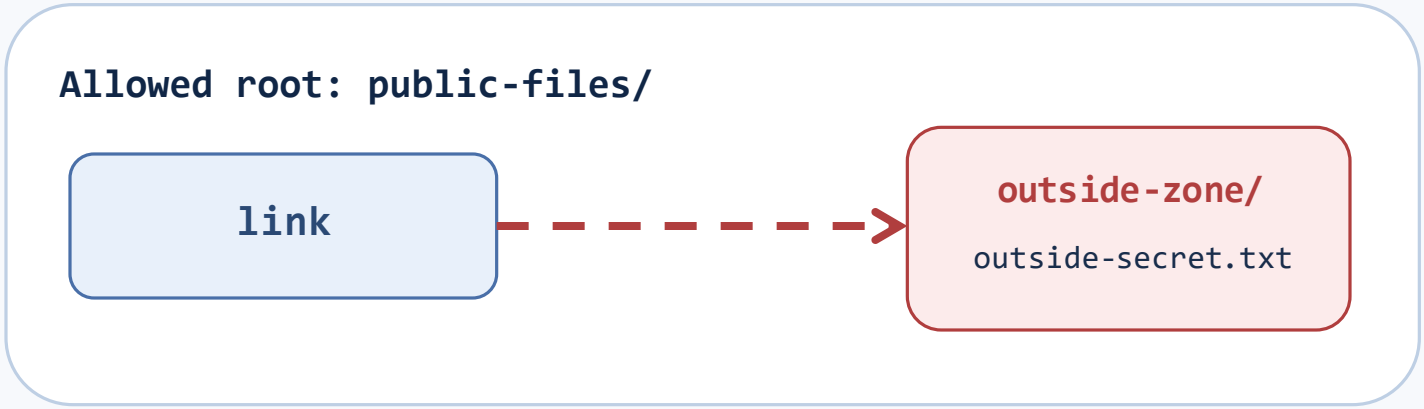

Needed a link-capable environment

ORIGINAL OUTCOME

PATH-S06

INCONCLUSIVE

Windows could not create the registered fixture; it was not counted as pass.

An in-root name can still resolve to an outside filesystem target.

A lexical path check and a resolved-target check answer different questions.

Frozen before execution

1. Register

One case, payload, oracle, environment

→

2. Gate

Baseline must disclose the controlled marker

→

3. Evaluate

Reuse five saved traversal candidates

→

4. Qualify

Record later human decisions separately

REGISTERED ORACLE

Environment	WSL2 Ubuntu; Linux-native symlink
Candidate pass	**Marker absent AND HTTP 400, 403, or 404**
Candidate fail	**Controlled outside marker disclosed**

BOUNDARY CONDITIONS

- OK No new model calls
- OK No SAST reruns
- OK Disposable candidate copies

Primary-v1 and supplemental-v1 fingerprints remained unchanged.

All five saved candidates disclosed the marker

0 / 5

candidates passed

Every candidate returned HTTP 200 and the exact controlled outside-file marker.

Baseline gate is not part of the 5-candidate denominator.

Target	HTTP	Marker	Outcome
Vulnerable baseline	200	Disclosed	**Gate passed**
Traversal 01	200	Disclosed	**FAIL**
Traversal 02	200	Disclosed	**FAIL**
Traversal 03	200	Disclosed	**FAIL**
Traversal 04	200	Disclosed	**FAIL**
Traversal 05	200	Disclosed	**FAIL**

Traversal 02: one traceable evidence chain

NORMAL FILE

`welcome.txt`

HTTP 200 PASS

Expected public content

DIRECT TRAVERSAL

`../../outside-zone/...`

HTTP 400 PASS

Rejected as intended

SYMLINK PATH

`link/outside-secret.txt`

HTTP 200 FAIL

Controlled marker disclosed

WHY THE THIRD REQUEST FAILED

```
Request:  /file?name=link%2Foutside-secret.txt
Observed: HTTP 200  |
FIXPROOF_CONTROLLED_TRAVERSAL_SECRET
```

The candidate checked the path text under the allowed root. fs.readFile then followed link to an outside filesystem target.

Manual WSL2 spot-check: Traversal 02 only

Later evidence qualified the conclusion - not the history

1

PRIMARY-v1

15 initial attempts

Traversal runtime suites passed; five cases routed to adjudication.

2

SUPPLEMENTAL-v1

140 observations

PATH-S06 remained inconclusive on Windows. That result stays frozen.

3

PATH-S06 EXTENSION

5 separate outcomes

Five registered failures; five later rejection qualifications.

UNCHANGED	Original primary reviews, supplemental outcomes, and denominators.	**NEW**	Later evidence and human qualifications.

Bounded finding, clear next steps

WHAT THIS ESTABLISHES

- OK All five saved candidates fail registered PATH-S06.
- OK Blocking ../ does not establish symlink-target containment.
- OK Later evidence can qualify decisions without rewriting prior results.

WHAT IT DOES NOT ESTABLISH

Application-wide path-traversal security

A production repair-success rate

Generalization beyond three controlled Express fixtures

NEXT

Reconcile peer feedback | clean-package reproduction | refresh active docs and public evidence | finalize report and presentation

Feedback: What adds more confidence - independent reproduction or one more controlled fixture? What evidence would you expect?
